

**UNIVERSITI KUALA LUMPUR**  
**INSTITUTE OF MEDICAL SCIENCE TECHNOLOGY**

---

**FINAL EXAMINATION**  
**OCTOBER 2025 SEMESTER**

---

**COURSE CODE** : HGB 30103

**COURSE NAME** : BIOSTATISTICS

**PROGRAMME NAME** : BACHELOR OF ENVIRONMENTAL HEALTH (Hons)  
BACHELOR OF BIOMEDICAL SCIENCE (HONOURS)  
BACHELOR OF OCCUPATIONAL SAFETY & HEALTH  
(HONOURS)

**DATE** : 26 JANUARY 2026

**TIME** : 9:00 AM – 12:00 PM

**DURATION** : 3 HOURS

---

**INSTRUCTIONS TO CANDIDATES**

---

1. Please CAREFULLY read the instructions given in the question paper.
2. This question paper has information printed on both sides of the paper.
3. This question paper consists of TWO sections.
4. Answer ALL questions for Section A.
5. Section B consist of four questions. Answer THREE (3) questions only.
6. Please write your answers on the answer booklet provided.
7. Answer all questions in English language ONLY.
8. Please answer MCQ/EMQ questions using OMR sheet.
9. Refer to the attached Formula/ Appendices.  Tick if applicable

---

THERE ARE 15 PAGES OF QUESTIONS, EXCLUDING THIS PAGE.

---

**SECTION A (Total: 40 marks)****INSTRUCTION: Answer ALL questions.****Please use the answer booklet provided.****Question 1**

Answer all the following questions.

- a. According to a report from the National Health Surveillance Unit dated 10th July 2024, 72% of dengue fever patients showed full recovery within the first week of diagnosis. If 25 dengue patients are randomly selected across Malaysia, what is the probability that at least 80% of them have recovered within the first week after receive treatment?

(5 marks)

- b. A large logistics company is evaluating workplace strain issues among its employees. Recent internal assessments showed that 42.5% of workers in the loading department reported experiencing work-related muscle strain, compared to 28.3% of employees in the dispatch department. To further assess the situation, an occupational safety officer randomly selected 300 workers from the loading department and 250 workers from the dispatch department for a detailed health survey.

What is the probability that the difference between the sample proportions of workers experiencing muscle strain in the two groups ( $\hat{p}_1 - \hat{p}_2$ ) will be less than 5%?

*Refer below – Table 1: Prevalence of asthma among workers from morning and evening shift*

(5 marks)

Table 1: Prevalence of workplace strain among workers from loading and dispatch department

| Department | $n$ | %    |
|------------|-----|------|
| Loading    | 300 | 42.5 |
| Dispatch   | 250 | 28.3 |

**Question 2**

Many neurological symptoms, including cognitive impairment, memory loss, and personality changes have been increasingly reported among automotive spray painters. All affected workers stated that they had been exposed to solvent-based paints and thinners over long periods (chronic exposure). The prevalence of neurological symptoms among the spray painters is shown in the table below.

*Refer below – Table 2: The prevalence of neurological symptoms among automotive spray painters*

Table 2: The prevalence of neurological symptoms among automotive spray painters

| Chronic exposure to solvent-based | Neurological symptoms |     | Total |
|-----------------------------------|-----------------------|-----|-------|
|                                   | Yes                   | No  |       |
| Yes                               | 35                    | 85  | 120   |
| No                                | 17                    | 155 | 172   |
| Total                             | 52                    | 240 | 292   |

- Compute the relative risk of neurological symptoms associated with the chronic exposure to solvent-based paint. Explain your result.  
(3 marks)
- Calculate the attributable risk. Explain your result.  
(4 marks)
- Compute the attributable risk percentage in the exposed group. Explain your result.  
(3 marks)

**Question 3**

Environmental health officers measured lead (Pb) concentrations (ng/m<sup>3</sup>) around a battery recycling center. Measurements were conducted in February and July after engineering improvements were implemented to minimize Pb emissions. The collected data were analysed using SPSS and are illustrated in the figure below.

Refer below – Figure 1: A.

| Statistics |          |        |    |                |                 |
|------------|----------|--------|----|----------------|-----------------|
|            |          | Mean   | N  | Std. Deviation | Std. Error Mean |
| Pair 1     | February | 257.73 | 30 | 49.040         | 8.954           |
|            | July     | 174.87 | 30 | 15.558         | 2.840           |

| Correlations |                 |    |      |
|--------------|-----------------|----|------|
|              |                 | N  | Sig. |
| Pair 1       | February & July | 30 | .043 |

| Test   |                 |        |                |                 |   |         |       |    |                 |
|--------|-----------------|--------|----------------|-----------------|---|---------|-------|----|-----------------|
|        |                 | Mean   | Std. Deviation | Std. Error Mean | 95% Confidence Interval of the Difference |         | t     | df | Sig. (2-tailed) |
|        |                 |        |                |                 | Lower                                     | Upper   |       |    |                 |
| Pair 1 | February - July | 82.867 | 56.687         | 10.349          | 61.700                                    | 104.034 | 8.007 | 29 | .000            |

Figure 1: A

- Assuming the data is normally distributed, determine the test used to analyse the above data and state the justification of using the selected test. (2 mark)
- State the null hypothesis for this analysis. (1 mark)
- Construct a reporting table to summarize the findings and interpret the results. (5 mark)
- Determine the decision-making process and state the conclusion based on the findings. (2 marks)

**Question 4**

A researcher conducted a cross-sectional study to examine the association between total cholesterol levels and age among adult patients at Putrajaya Hospital who are following a carbohydrate-controlled diet. Total cholesterol levels were obtained through fasting blood tests, while age information was collected through medical records. The collected data were analysed using SPSS and are illustrated in the figures below.

*Refer below – Figure 2: B.*

**Descriptive Statistics**

|                            | Mean  | Std. Deviation | N  |
|----------------------------|-------|----------------|----|
| Total cholesterol (mmol/L) | 4.151 | .2748          | 35 |
| Age (year)                 | 26.63 | 6.353          | 35 |

**Correlations**

|                     |                            | Total cholesterol (mmol/L) | Age (year) |
|---------------------|----------------------------|----------------------------|------------|
| Pearson Correlation | Total cholesterol (mmol/L) | 1.000                      | -.990      |
|                     | Age (year)                 | -.990                      | 1.000      |
| Sig. (1-tailed)     | Total cholesterol (mmol/L) | .                          | .000       |
|                     | Age (year)                 | .000                       | .          |
| N                   | Total cholesterol (mmol/L) | 35                         | 35         |
|                     | Age (year)                 | 35                         | 35         |

**Model Summary**

| Model | R                 | R Square | Adjusted R Square | Std. Error of the Estimate |
|-------|-------------------|----------|-------------------|----------------------------|
| 1     | .990 <sup>a</sup> | .979     | .978              | .0403                      |

| Skewness                   | -.016                            | .398        |            |  |
| Kurtosis                   | -.863                            | .778        |            |  |

Figure 2: B

- a) Assuming the data is not normally distributed. From the SPSS output above, select the correct analysis test used to analyse the above situation. Provide justification of the test selection and state the null hypothesis for the analysis.  
(3 marks)
- b) Identify the dependent and independent variables used in this analysis.  
(1 mark)
- c) Using the SPSS Output, identify the relevant findings and construct a reporting table to summarize the findings. Provide clear interpretation of the results.  
(4 marks)
- d) Determine if there is a statistically significant association between total cholesterol levels and age among adult patients at Putrajaya Hospital who are following a carbohydrate-controlled diet. Justify your determination.  
(2 marks)

**SECTION B (Total: 60 marks)**

Answer **THREE (3)** questions only.

Please use the answer booklet provided.

**Question 1**

A medical researcher conducted a study to determine the average fasting blood glucose level (mg/dL) among patients with prediabetes attending two districts government health clinics. The data collected from all participating patients are summarized in the table below.

Refer below – Table 3: Summary of fasting blood glucose level (mg/dL) among prediabetic patients

Table 3: Summary of fasting blood glucose level (mg/dL) among prediabetic patients

| District  | Number of prediabetic | Mean  | Standard deviation |
|-----------|-----------------------|-------|--------------------|
| Kajang    | 200                   | 174.6 | 30.5               |
| Putrajaya | 150                   | 204.1 | 28.7               |

- a. What is the probability that the difference of mean fasting blood glucose level of prediabetic patients,  $\bar{x}_1 - \bar{x}_2$  between this two universities is more than 40.0 (mg/dL)?  
(6 marks)
- b. Using the data provided in the table above, construct a 95% confidence interval for the true difference in mean fasting blood glucose levels between the two populations ( $\mu_1 - \mu_2$ ).  
(7 marks)
- c. Using the data provided in the table above, construct a 90% confidence interval for the true difference in mean fasting blood glucose levels between the two populations ( $\mu_1 - \mu_2$ ).  
(7 marks)

**Question 2**

A research team investigated the prevalence of anemia among pregnant women in Selangor. They collected blood samples from 400 women attending antenatal clinics and measured their hemoglobin levels (g/dL). The analysis revealed an average blood hemoglobin concentration of 12.8 g/dL with a standard deviation of 1.5 g/dL.

a) Calculate the percentage of pregnant women with hemoglobin level of 10 g/dL and lower.

(4 marks)

b) Calculate the percentage of pregnant women with hemoglobin levels 13 to 17 g/dL.

(9 marks)

c) Determine the central limits for 90 percent of hemoglobin levels present.

(7 marks)

**Question 3**

Answer all the following questions.

- a) A researcher at Putrajaya Health Centre collected data from patients diagnosed with hypertension, cancer and kidney disease. The research tries to understand how health status influences the type of treatment chosen. The data collected were analysed using SPSS and are presented in figures below.

Refer below – Figure 3: C & Figure 4: D

Figure 3: C

|                |                |                         | Health status | Treatment type |
|----------------|----------------|-------------------------|---------------|----------------|
| Spearman's rho | Health status  | Correlation Coefficient | 1.000         | -.171          |
|                |                | Sig. (2-tailed)         | .             | .122           |
|                |                | N                       | 83            | 83             |
|                | Treatment type | Correlation Coefficient | -.171         | 1.000          |
|                |                | Sig. (2-tailed)         | .122          | .              |
|                |                | N                       | 83            | 83             |

Figure 4: D

- i. Assuming the data is not normally distributed. From the SPSS Outputs above, select the correct analysis test used to analyse the above situation. Provide justification of the test selection and state the null hypothesis for the analysis. (3 marks)
- ii. Identify the dependent and independent variables used in this data analysis. (1 marks)
- iii. Using the SPSS Output, identify the relevant findings and construct a reporting table to summarize the findings. Provide clear interpretation of the results. (4 marks)
- iv. Determine if there was a statistically significant association between health status and type of treatment chosen among patients in Putrajaya Health Centre. Justify your determination. (2 marks)

b) A small survey was conducted by the occupational safety officer to assess the relationship between noise-induced hearing impairment and the workers' workstation positions relative to the heavy-machinery noise sources. All 14 workers from Factory MN were examined using an audiometry booth as part of the assessment. The collected data were analysed using SPSS and are presented in the figures below.

Refer below – Figure 5: E

**Case Processing Summary**

|  | Valid |         | Cases Missing |         | Total |         |
|--|-------|---------|---------------|---------|-------|---------|
|  | N     | Percent | N             | Percent | N     | Percent |
| Workstation Positions * Noise-induced Hearing Impairment | 14    | 100.0%  | 0             | 0.0%    | 14    | 100.0%  |

a. 3 cells (75.0%) have expected count less than 5. The minimum expected count is .86.

b. Computed only for a 2x2 table

Figure 5: E

- i. Identify the correct analysis used to analyse the above situation. Provide justification of the test selection and state the null hypothesis for the analysis.  
(3 marks)
- ii. Identify the dependent and independent variables used in this analysis.  
(1 mark)
- v. Using the SPSS Output, identify the relevant findings and construct a reporting table to summarize the findings. Provide clear interpretation of the results.  
(4 marks)
- iii. Determine if there was a statistically significant relationship between noise-induced hearing impairment and the workers' workstation positions among 14 store workers in Factory MN. Justify your determination.  
(2 marks)

**Question 4**

Answer all the following questions.

- a) A comparative health study was conducted to determine the high-density lipoprotein (HDL) or “good cholesterol” markers among individuals with two different lifestyle categories (active in regular exercise and those with a sedentary lifestyle.) The measurements were taken after 60 days of monitoring. HDL is recognized as a protective factor against heart disease, with higher HDL levels associated with a lower risk of developing cardiovascular conditions. The collected data were analysed using SPSS and are presented in figure below.

*Refer below – Figure 6: F*

**Group Statistics**

|             | Lifestyle        | N  | Mean    | Std. Deviation | Std. Error Mean |
|-------------|------------------|----|---------|----------------|-----------------|
| HDL (mg/dL) | Sedentary        | 30 | 38.9667 | 9.67928        | 1.76719         |
|             | Regular exercise | 30 | 44.4000 | 10.00207       | 1.82612         |

- i. Assuming the data is normally distributed. From the SPSS Outputs, select the correct analysis test used to analyse the above situation. Provide justification of the test selection and state the null hypothesis for the analysis. (3 marks)
  
- ii. Using the SPSS Output, identify the relevant findings and construct a reporting table to summarize the findings. Provide clear interpretation of the results. (5 marks)
  
- iii. Determine if there was a statistically significant difference in HDL (mg/dL) between individuals with two different lifestyle categories (regular exercise and sedentary lifestyle). Justify your determination. (2 marks)

b) An environmental consultant company was appointed to determine the levels of chromium (Cr) in the soil samples collected from Bukit Goh area, Kuantan, near the bauxite mining activity. During the investigation, it was confirmed that villagers living in the vicinity of Bukit Goh were exposed to this carcinogenic heavy metal. The study also included measuring Cr levels in the villagers' blood samples to assess potential health effects resulting from exposure through inhalation, skin contact, and ingestion. The collected data were analysed using SPSS and are presented in figures below.
